Quick Start Guide

Flexible Wavelength Selector - Basic

1

▷▷▷This arrow indicates the directionality of the light source.

2

As seen on the image at the right, there are three knobs. The two knobs on the left can be used to select your desired wavelength while the third knob is used to precisely compensate the directionality offset of the light.
3

On the knobs you will be able to see markings L and S which refers to long and short wavelength, respectively.

4

By referring to the wavelength table in our website, it is possible to select both the center wavelength and the FWHM. For accurate determination of the center wavelength and the FWHM, please use a spectrometer.
